

REQUIRED INFORMATION FORM

INSTRUCTIONS: This form is to be filled out completely and must be the first page of any document, including all reports, submitted to the Los Angeles Fire Department (LAFD) Underground Storage Tank Unit (UST). To ensure accuracy this form must be completed on the computer or typed out. Hand printing or writing will not be accepted. The correct LAFD Facility I.D. No. and Division 5 Permit No. must be included for the submittal to be processed.

**** (SOME INFORMATION IS ALREADY PRE-ENTERED FOR YOUR CONVENIENCE)**

PLEASE NOTE THAT AN ACCOMPANYING INTRODUCTORY LETTER ON YOUR COMPANY LETTERHEAD CANNOT BE SUBSTITUTED FOR THIS FORM.

and Remedial Action Plan
ARCO Facility 00191
3401 Whittier Boulevard
Los Angeles, California
LAFD Facility ID No.10846, Division 5 Permit No. 9894**

Dear Inspector Palmer:

SECOR International Incorporated (SECOR), on behalf of the Atlantic Richfield Company (Atlantic Richfield), is pleased to present this *Additional Requirements–Site Assessment Report and Remedial Action Plan (RAP)* for ARCO Facility 00191 (site), located at 3401 Whittier Boulevard, in Los Angeles, California (Figures 1 and 2). This additional work was performed in response to the directive by the City of Los Angeles Fire Department (LAFD) dated April 22, 2004 (Appendix A). All work was conducted according to SECOR's *Workplan for Site Assessment*, submitted to the LAFD on January 4, 2002. Soil boring B-9 was drilled in November 2004 to provide additional lateral definition of petroleum hydrocarbon impacted soil at the site. Site assessment work was completed on December 29, 2004 after receipt of the final analytical results and the generated waste was characterized and properly disposed of or recycled. This report summarizes site description, regional geology and hydrogeology, site background, potential receptors, current site assessment activities, scope of additional field work, findings, conclusions and recommendations, RAP and limitations.

SITE DESCRIPTION

The site is an active ARCO gasoline service station and am/pm™ mini mart, located on the northeast corner of Whittier Boulevard and Lorena Street in the City of Los Angeles (Figure 1). The site is positioned at an elevation of approximately 290 feet above mean sea level (amsl). Local topography slopes to the south at approximately 0.045 feet per foot (USGS, 1966). The facility consists of a station building located near the center of the site, three 12,000 gallon, double-walled fiberglass underground storage tanks (USTs) located in the southern portion of the site with two dispenser islands to the north and one dispenser island to the southwest of the USTs.

REGIONAL GEOLOGY/HYDROGEOLOGY

Physiographically, the site is situated in the northwestern portion of the Montebello Plain. The Montebello Plain, gently sloping and relatively flat, is composed of alluvial materials that overlie a marine-cut terrace. The Montebello Plain is approximately seven miles wide and extends from the Repetto and Merced Hills in the north to the Rio Hondo River and Whittier Narrows to the south and southeast. The Montebello Plain is bounded on the west by the Los Angeles Narrows and the on the west and southwest by the Los Angeles River.

Site and vicinity soils are mapped as Upper Pleistocene age Lakewood Formation (Qlw). The Qlw is approximately 160 feet thick in the vicinity of the site and generally consists of terrace deposited gravel, sand, sandy silt, silt, and clay, and may also contain a semi-perched aquifer, the Bellflower Aquiclude, and the Exposition and Gage Aquifers.

The site is situated within the Montebello Forebay Area of the Los Angeles Central Groundwater Basin. The Central Groundwater Basin is bounded on the west and south by the Newport/Inglewood Uplift and on the north by the Hollywood Basin. The low lying Elysian Hills border the northwest of the basin and to the southeast are the Puente Hills. The Los Angeles Central Groundwater Basin is divided into three areas: the Los Angeles Forebay and Montebello Forebay Areas and the Pressure Area. The Forebay refers to the areas of intake or recharge, where the major basin aquifers are replenished; the Pressure Area is generally defined as the area in the basin where surface water and shallow groundwater are prevented from percolating in large quantities into the major producible aquifers by clays and silt layers at shallow depths. The primary water-producing aquifers for the Los Angeles Central Groundwater Basin are those within the lower Lakewood Formation and the underlying San Pedro Formation.

In the vicinity of the site, the Bellflower Aquiclude, consisting of sandy-gravelly clay-rich sediments, is approximately 60 feet thick. The Exposition Aquifer extends from approximately 60 to 110 feet below ground surface (bgs) and is comprised of lenticular sandy and gravelly beds separated by fine lenses of silt and clay. The Gage Aquifer extends from approximately 110 to 160 feet bgs, is merged with the overlying Exposition Aquifer, and is comprised of sand and sandy clay with some gravel. The Aquifers of the San Pedro Formation (Hollydale, Lynwood, Silverado, and Sunnyside) are composed of coarse-grained sands and gravels. The Hollydale Aquifer occurs approximately 175 to 190 feet bgs, the Lynwood Aquifer occurs approximately 325 to 400 feet bgs, the Silverado Aquifer occurs 525 to 650 feet bgs and the Sunnyside Aquifer occurs 875 to 1,025 feet bgs in the vicinity of the site.

The closest naturally occurring surface water is the Los Angeles River channel, located approximately 1.5 miles west of the site. The Los Angeles River carries surface water from the San Fernando Valley into the Coastal Plain through the Los Angeles Narrows. The Los Angeles Narrows, a natural topographic separation between the Elysian and Repetto Hills, is located approximately three miles from the site. The area in the vicinity of the Los Angeles Narrows is a regional ground water recharge area. The regional groundwater flow is anticipated to be south to southeast (CDWR, 1961).

SITE BACKGROUND

On June 13, 1989, Hunter/Gregg Incorporated (Hunter) performed a pre-drill assessment prior to the removal of three USTs. Three soil borings (B1 through B3) were installed to a depth of 40 feet bgs peripheral to the USTs. Soil boring locations are shown on Figure 2. Two samples from each boring were analyzed for total petroleum hydrocarbons as gasoline (TPHg). No detectable concentrations of TPHg were identified in any of the submitted soil samples (Hunter, 1989). Soil analytical data is provided in Table 1.

In July 1989, Hunter observed the removal of two 8,000-gallon and one 6,000-gallon steel USTs at the site. Soil samples WL-1 through WL-5 were collected approximately two feet beneath the former USTs and samples WL-3A and WL-5A were collected approximately six feet beneath the former USTs (Figure 2). Stockpile soil samples WL-7 through WL-10 and SP-1 were also collected for laboratory analysis. Elevated TPHg concentrations were primarily detected near the northeastern portion of the UST excavation at a maximum concentration of 7,320 milligrams per kilogram (mg/kg) TPHg (WL-5, Table 1). Three new 12,000-gallon, double-walled plasteel USTs were installed within the same excavation (Hunter, 1989B). Approximately 400 tons of soil excavated during facility upgrade activities was transported off site.

On December 17 and 18, 1990, and February 6, 1991, Environmental Science & Engineering Incorporated (ESE) advanced six soil borings (B4 through B9), converting boring B6 to a soil vapor extraction (SVE) well VW-1 (Figure 2). Soil samples collected from the boring contained detectable TPHg concentrations ranging from 1.7 mg/kg (B9-25) to 13,000 mg/kg (B8-25). Detectable benzene concentrations ranged from 0.11 mg/kg (B-9-30) to 81 mg/kg (B8-25) (Table 1). Groundwater was not encountered during the drilling investigation (ESE, 1991).

On May 14, 1991, ESE installed two SVE Wells, VW-2 and VW-3 (Figure 2). Soil samples were collected from the borings and analyzed for TPHg and for benzene, toluene, ethylbenzene and total xylenes (collectively BTEX). Maximum concentrations of 87 mg/kg TPHg and 0.69 mg/kg benzene were detected in soil sample VW-2, collected at approximately 24 feet bgs (Table 1) (ESE, 1991).

On June 4, 1991, ESE performed a SVE test using Wells VW-1 through VW-3. Air flow rates ranged from 50 to 74 standard cubic feet per minute (scfm) at vacuums ranging from 0.26 to 11 inches of water. The calculated radius of influence (ROI) ranged from 25 to 40 feet. Air samples collected during the SVE test contained maximum concentrations of 890 parts per million by volume (ppmv) TPHg and 21 ppmv benzene from Well VW-3 (ESE, 1991).

On March 24, 1992, ESE installed additional SVE Well VW-4 (Figure 2) to a depth of approximately 35 feet bgs. Soil samples collected from the boring for laboratory analysis contained maximum concentrations of 3,100 mg/kg TPHg (VW4-10) and 0.77 mg/kg benzene (VW4-10). Soil analytical data is provided on Table 1 (ESE, 1992).

On May 19, 1994, a SVE system consisting of a 200 scfm positive displacement blower coupled to two 1,200-pound vapor-phase carbon canisters began continuous operation. Initial concentrations of 2,650 ppmv TPHg and 620 ppmv benzene were detected in vapor samples. Due to high source concentrations, in February of 1995 an internal combustion engine (ICE) was installed, replacing the carbon system. The ICE system operated until October of 1996, removing approximately 20,504 pounds of the total volatile hydrocarbons

(TVH) and 29.9 pounds of benzene from the subsurface soils. The site received a letter of no further action from the LAFD on October 15, 1997. The SVE system operational data is reported in EMCON's Fourth Quarter 1996 VES Performance Report; tables and graphs are provided in Appendix B (EMCON, 1997).

On July 2 and 5, 2001, Delta Environmental Consultants, Incorporated (Delta) collected eight soil samples from beneath the former dispensers (D1 through D6 and D1-05 and D2-05) and seven samples beneath the former product lines (P1 through P4 and P1-05 through P3-05) during facility upgrade activities (Figure 2). Soil samples were analyzed for TPHg and for BTEX, methyl tertiary butyl ether (MTBE), tertiary butanol (TBA), di-isopropyl ether (DIPE), ethyl tertiary butyl ether (ETBE), and tertiary amyl methyl ethyl ether (TAME). Detectable concentrations of adsorbed-phase hydrocarbons were identified in 13 of the 15 soil samples at maximum concentrations of 1,700 mg/kg TPHg (P2), 7.8 mg/kg benzene (D5), 15 mg/kg MTBE (D5) and 0.36 mg/kg TBA (P1); DIPE, ETBE, and TAME were not detected (Table 1) (Delta, 2001).

In March 2003, SECOR advanced Soil Borings SB-1 through SB-7 to define the lateral and vertical extent of petroleum hydrocarbon impact detected during facility upgrade activities conducted in July 2001 (Figure 2). During the installation of SB-4 and SB-5, elevated hydrocarbons were encountered at shallow depths (to approximately 30 feet bgs) and the borings were converted to dual nested SVE Wells SVE-1 and SVE-2, respectively. Soil samples were collected from all the borings and analyzed for TPHg, BTEX, MTBE, DIPE, ETBE, TAME, TBA and ethanol. Maximum concentrations of 6,800 mg/kg TPHg (SVE-2-25), 3.4 mg/kg benzene (SVE-2-25), and 0.072 mg/kg MTBE (SVE-2-20) were detected in soil samples analyzed. DIPE, ETBE, TAME and ethanol were not detected. Soil analytical data is provided in Table 1 and SVE well construction details are provided in Table 3. SECOR submitted a Site Assessment Report and Request for Closure on August 13, 2003 (SECOR, 2003).

On April 22, 2004, Atlantic Richfield received a directive from the LAFD requiring additional site assessment and remediation. The LAFD requested additional lateral definition of hydrocarbon impacted soil in the southwestern portion of the site (vicinity of SB-4/SVE-1 and SB-5/SVE-2) and the submittal of a RAP to address the elevated hydrocarbon concentrations detected in shallow soil in the vicinity of SB-4/SVE-1 and SB-5/SVE-2 (Appendix A).

POTENTIAL RECEPTORS

According to the Los Angeles County Department of Public Works (LACDPW) Division of Hydrologic Records, there are two wells (2808C and 2818C) located within a one-mile radius of the site. Both wells are reportedly inactive. Well 2808C is located approximately 3,200 feet south of the site, and was last gauged on April 14, 1978 with a depth to groundwater of 241.7 feet bgs. Well 2818C is located approximately 5,280 feet southeast of the site, and was last gauged on October 31, 1988 with a depth to groundwater of 191.0 feet bgs. Inactive Public Supply well 2818D is located approximately 5,600 feet southeast of the site and was last gauged on May 31, 1978 with a depth to ground water of 227.0 feet bgs. The well receptor information is summarized in Table 2. Groundwater beneath the site is anticipated to be encountered at depths greater than 240 feet bgs.

SECOR performed additional research using the Geographic Environmental Information Management System (GEIMS) database via the Geotracker website

(<http://geotracker.swrcb.ca.gov/>). According to the GEIMS database, there are no municipal wells identified within a half-mile radius of the site.

SCOPE OF ADDITIONAL FIELD WORK

Pre-field Activities

All field activities were completed with safety as a foremost concern. A site-specific health and safety plan (HASP) was prepared for the drilling and potential well installation activities conducted at the site. All SECOR personnel, as well as any other on-site subcontractors or regulatory personnel, were required to familiarize themselves with and sign the HASP in an attempt to minimize safety hazards. Prior to drilling at the site, SECOR marked the proposed boring location and notified Underground Service Alert-South (USA), a California State-specific underground utility notification service. USA contacted the owners of the various utilities in the vicinity of the site to mark the locations of their underground utilities. Additionally, Spectrum Geophysics, a private utility locator, was contracted to further evaluate and mark the locations of any potential subsurface underground utilities not identified by USA. All prefield activities, including utility clearance, were conducted according to *Precautionary Procedures and Guidelines Document for Drilling, Subsurface Investigations and Remedial Construction Activities for GEM Retail Operations*. Notifications were made to the LAFD, the facility manager, the drilling contractor, and Atlantic Richfield at least 5 days prior to the initiation of work.

Soil Boring Installation

On November 10, 2004, SECOR supervised CAL PAC Drilling (CAL PAC) of Calimesa, California (C57 #766402) during the advancement of Soil Boring B-9. Prior to any invasive work, CAL PAC hand augered to a minimum depth of 5 feet bgs in an effort to prevent compromising the integrity of unidentified subsurface obstructions. Drilling was completed using a CME-85 drill rig equipped with hollow-stem augers. Soil Boring B-9 was installed in the southwestern portion of the site in the vicinity of SVE Well SVE-1.

For logging, field screening and laboratory analysis, sixteen soil samples were collected at five-foot intervals from approximately 5 to 80 feet bgs (maximum depth explored). Qualified SECOR personnel, working under direct supervision of a State of California Registered Professional Engineer logged the borings in accordance with the Unified Soil Classification System, using visual and manual methods for parameters including odor, staining, color, grain size, and moisture content. Collected soil samples were field screened for volatile organic compounds (VOC) using a MiniRae 2000 photo-ionization detector (PID). All soil samples collected for laboratory analysis were prepared in accordance with EPA Method 5035 using 5 gram EnCore™ samplers and placed in an ice filled cooler for preservation. The samples were transported under chain-of-custody (COC) protocol to Del Mar Analytical (Del Mar), in Irvine, California, a state of California certified laboratory for analysis. The soil boring was backfilled to approximately 3 feet bgs with high solids bentonite grout, capped with two feet of hydrated bentonite chips, and sealed at the surface with concrete dyed to match the existing surface grade. Drilling and soil sampling procedures are provided in Appendix C.

Waste Disposal

Soil cuttings generated during drilling activities were placed in labeled, Department of Transportation approved, 55-gallon steel drums and stored on-site pending receipt of the analytical results. Following analytical characterization, soil drums were removed from the site by Belshire Environmental, Incorporated and transported to TPS Technologies, Incorporated in Adelanto, California, for recycling. Waste disposal documentation for soil is presented in Appendix D.

FINDINGS

Site Geology

Soils encountered during this investigation consisted of silt with sand, silty sand, and silt from surface grade to approximately 22 feet bgs. Well-graded sand with gravel and interbedded poorly graded sand and silt was encountered from approximately 22 to 42 feet bgs underlain by a silt layer from approximately 42 to 52 feet bgs. Well-graded sand with gravel was observed between 52 and 77 feet bgs, and silty sand was encountered from approximately 77 to 80 feet bgs (total depth explored). Groundwater was not encountered during drilling activities. Geologic cross-sections A-A' and B-B' depict the subsurface lithology and are provided as Figures 3 and 4. Drill logs for boring B-9 are provided in Appendix E.

Organic Vapor Analysis

Organic vapors were measured in the field using a MiniRae 2000 PID. Elevated hydrocarbon vapors were primarily detected at depths between approximately 20 and 35 feet bgs. Field concentrations of organic vapors are provided on the boring logs in Appendix E.

Soil Analytical Results

All soil samples were relinquished to Del Mar and analyzed for carbon chain C₄ through C₁₂, gasoline range organics (GRO) according to EPA Method 8015, and for BTEX, MTBE, DIPE, ETBE, TAME, TBA and ethanol by EPA Method 8260B. Petroleum-hydrocarbon constituents were detected in soil samples collected primarily between approximately 20 and 30 feet bgs. Maximum concentrations of 5,900 mg/kg GRO (B-9-30), 1.3 mg/kg benzene (B-9-20), 0.0048 J (J indicates estimated value) mg/kg MTBE (B-9-35) and 0.034 J mg/kg TBA (B-9-15) were detected in soil samples analyzed. Hydrocarbons were below laboratory reporting limits in soil samples collected below 30 feet bgs. DIPE, ETBE, TAME and ethanol were not detected in any of the soil samples. Soil sample analytical data is summarized in Table 1. Copies of the certified laboratory analytical reports and COC documentation are included in Appendix F.

CONCLUSIONS and RECOMMENDATIONS

Soil Borings SB-1, SB-2, and SB-3 adequately defined the lateral and vertical extent of the hydrocarbon impacted soil in the UST area. Borings SB-6 and SB-7, installed north of the northern most product dispenser islands, provided lateral and vertical definition of the hydrocarbon plume in this area. Soil Borings SB-4/SVE-1 and SB-5/SVE-2, installed in the southwestern portion of the site, defined the vertical extent of hydrocarbon impacted soil.

Soil Boring B-9, located in the southwestern portion of the site, contained hydrocarbon impacted soil to a depth of approximately 30 feet bgs. Hydrocarbon concentrations were not detected above the laboratory reporting limit between 35 and 80 feet bgs, providing adequate vertical definition with approximately 50 vertical feet of clean soil. The lateral extent of the hydrocarbon impacted soil is not assessed in the southwestern portion of the site. The lateral extent of hydrocarbon impacted soil is adequately defined by SB-1 and SB-3 to the southeast, by SB-2 to the south, and by SB-6 and SB-7 to the north-northeast. Based on soil analytical data the lateral extent of impacted soil is apparently limited as shown in Figure 5.

Due to the location of numerous on and off-site subsurface obstructions detected during SECOR's prefield investigation activities, there is a significant hazard of encountering subsurface interference in the southwestern corner of the site and at the intersection of Whittier Boulevard and Lorena Street. SECOR does not propose additional lateral assessment in the vicinity of B-9 at this time.

REMEDIAL ACTION PLAN

Remedial Objective

On behalf of Atlantic Richfield, SECOR submits this RAP, which proposes SVE technology to mitigate hydrocarbon impacted soil at the site. The remedial objective for this site is to remove hydrocarbon mass from the subsurface in the vicinity of SVE-1, SVE-2 and B-9, and ultimately obtain site closure.

Summary of Hydrocarbon Distribution in Soil

Based on the recent assessments, residual hydrocarbons are primarily at depths between 20 and 30 feet bgs near the dispenser islands in the vicinity of SVE Wells SVE-1 and SVE-2 and Soil Boring B-9. The maximum concentrations of 6,800 mg/kg GRO and 3.4 mg/kg benzene were detected in Soil Sample SVE-2 collected at 25 feet bgs and the maximum concentration of 0.072 mg/kg MTBE was detected in Soil Sample SVE-2 collected at 20 feet bgs. Hydrocarbon concentrations decrease significantly below depths of approximately 30 feet bgs.

Soil Vapor Extraction

SVE is well documented for the remediation of VOCs, particularly lighter GRO hydrocarbons. SVE is the process in which soil vapors are extracted from the impacted vadose zone by placing a vacuum on one or more SVE wells. Extracted hydrocarbons are destroyed by a selected abatement device prior to discharge to the atmosphere, while operating under the SCAQMD jurisdiction. During the SVE test conducted at the site by ESE in 1991, air flow rates ranged from 50 to 74 scfm at vacuums ranging from 0.26 to 11 inches of water. The calculated ROI ranged from 25 to 40 feet. Between May 1994 and October 1996, SVE conducted at the site removed approximately 20,504 pounds of the total volatile hydrocarbons (TVH) and 29.9 pounds of benzene from the subsurface soils.

Proposed Remedial Action

SECOR proposes to conduct limited active soil remediation utilizing a mobile SVE unit, operating under an approved SCAQMD various locations permit. It is proposed to extract vapors from existing SVE Wells SVE-1 and SVE-2 (Figures 2 and 5). SVE Wells SVE-1 and SVE-2 are located in the area of hydrocarbon impact. Based on prior SVE activities conducted at the site with expected ROI of between 25 and 40 feet, extracting from these wells should provide adequate coverage of the hydrocarbon impacted soil.

Vacuum, vapor extraction flow rates and hydrocarbon concentrations in extracted soil vapors will be measured in the field in accordance with all permit regulations. Vacuum influence will be verified in the field. Soil vapor samples will be collected and submitted to an Atlantic Richfield approved, California State DHS Certified laboratory and analyzed for GRO, BTEX, MTBE, DIPE, ETBE, TAME, TBA and ethanol according to appropriate EPA methods and permit conditions. The analytical data will be used to validate the decrease in hydrocarbon concentrations over time. System operating parameters and duration will be used to calculate the pounds of petroleum hydrocarbons removed from the subsurface during the remedial activities.

The goal of the proposed remedial action is to reduce hydrocarbon concentrations in subsurface soil. SECOR recommends operating the SVE system for approximately two weeks per month for approximately three months or until hydrocarbon concentrations decrease and become asymptotic. When hydrocarbon concentrations become asymptotic, rebound testing will be conducted to verify completion of soil remediation activities. Upon completion, SECOR will prepare a report describing the SVE activities, including figures, field data, laboratory analytical data, mass removal rates and mass removal volume. Once the remediation has been deemed sufficient, SECOR will submit a request for closure.

STANDARD LIMITATIONS

All work was performed under the supervision of a registered professional as defined in the Professional Geologist Act of the California Code of Regulations. The information contained in this report represents SECOR's professional opinions, and is based in part on information supplied by the client. These opinions are based on currently available information and are arrived at in accordance with currently accepted geologic, hydrogeologic and engineering practices at this time and location. Other than this, no warranty is implied or intended.

SOIL SAMPLE LOCATIONS WITH TOTAL
PETROLEUM HYDROCARBONS, BENZENE
AND MTBE CONCENTRATIONS REPORTED
IN MILLIGRAMS PER KILOGRAM (mg/Kg)

ESTIMATED VALUE; BELOW LABORATORY REPORTING LIMIT AND ABOVE METHOD DETECTION LIMIT (MDL)

1

SCREENED INTERVAL OF WELL
RELATIVE TO TOP OF CASING

1

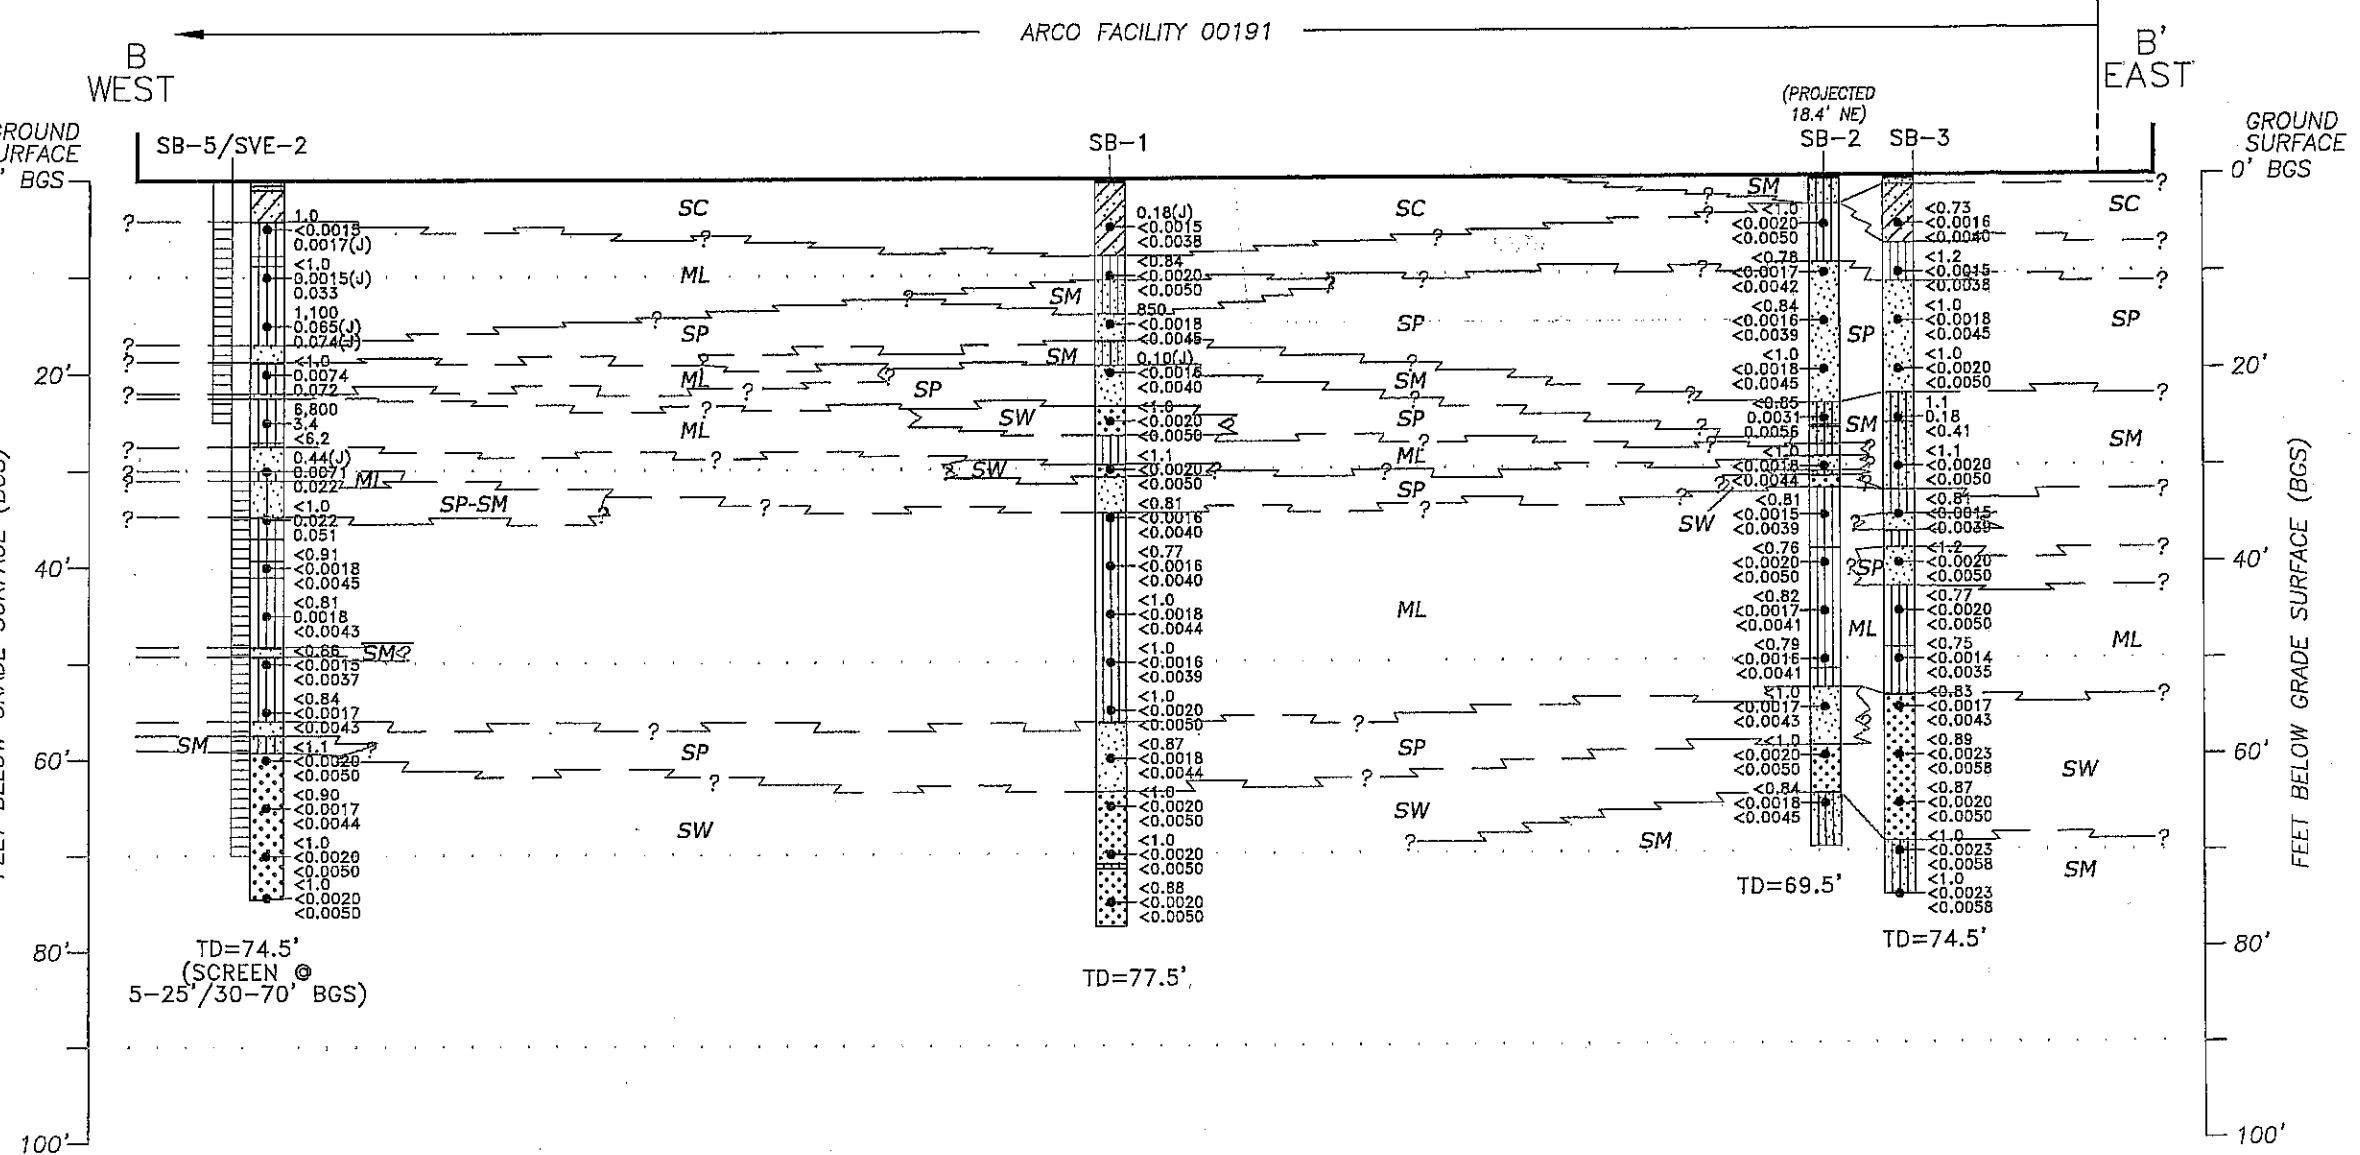

APPROXIMATE LITHOLOGIC CONTACT,
QUERIED (?) WHERE INFERRED

HORIZONTAL SCALE IN FEET: 0 10 20

VERTICAL SCALE IN FEET: 0 20 40

NOTES:

1. GROUND SURFACE NOT ADJUSTED TO DEPICT ELEVATIONS AND RELATIVE TOPOGRAPHY.
 2. HORIZONTAL EXAGGERATION OF WELLS DONE FOR CLARITY. FIGURE DOES NOT REFLECT ACTUAL BOREHOLE DIAMETERS.

LEGEND

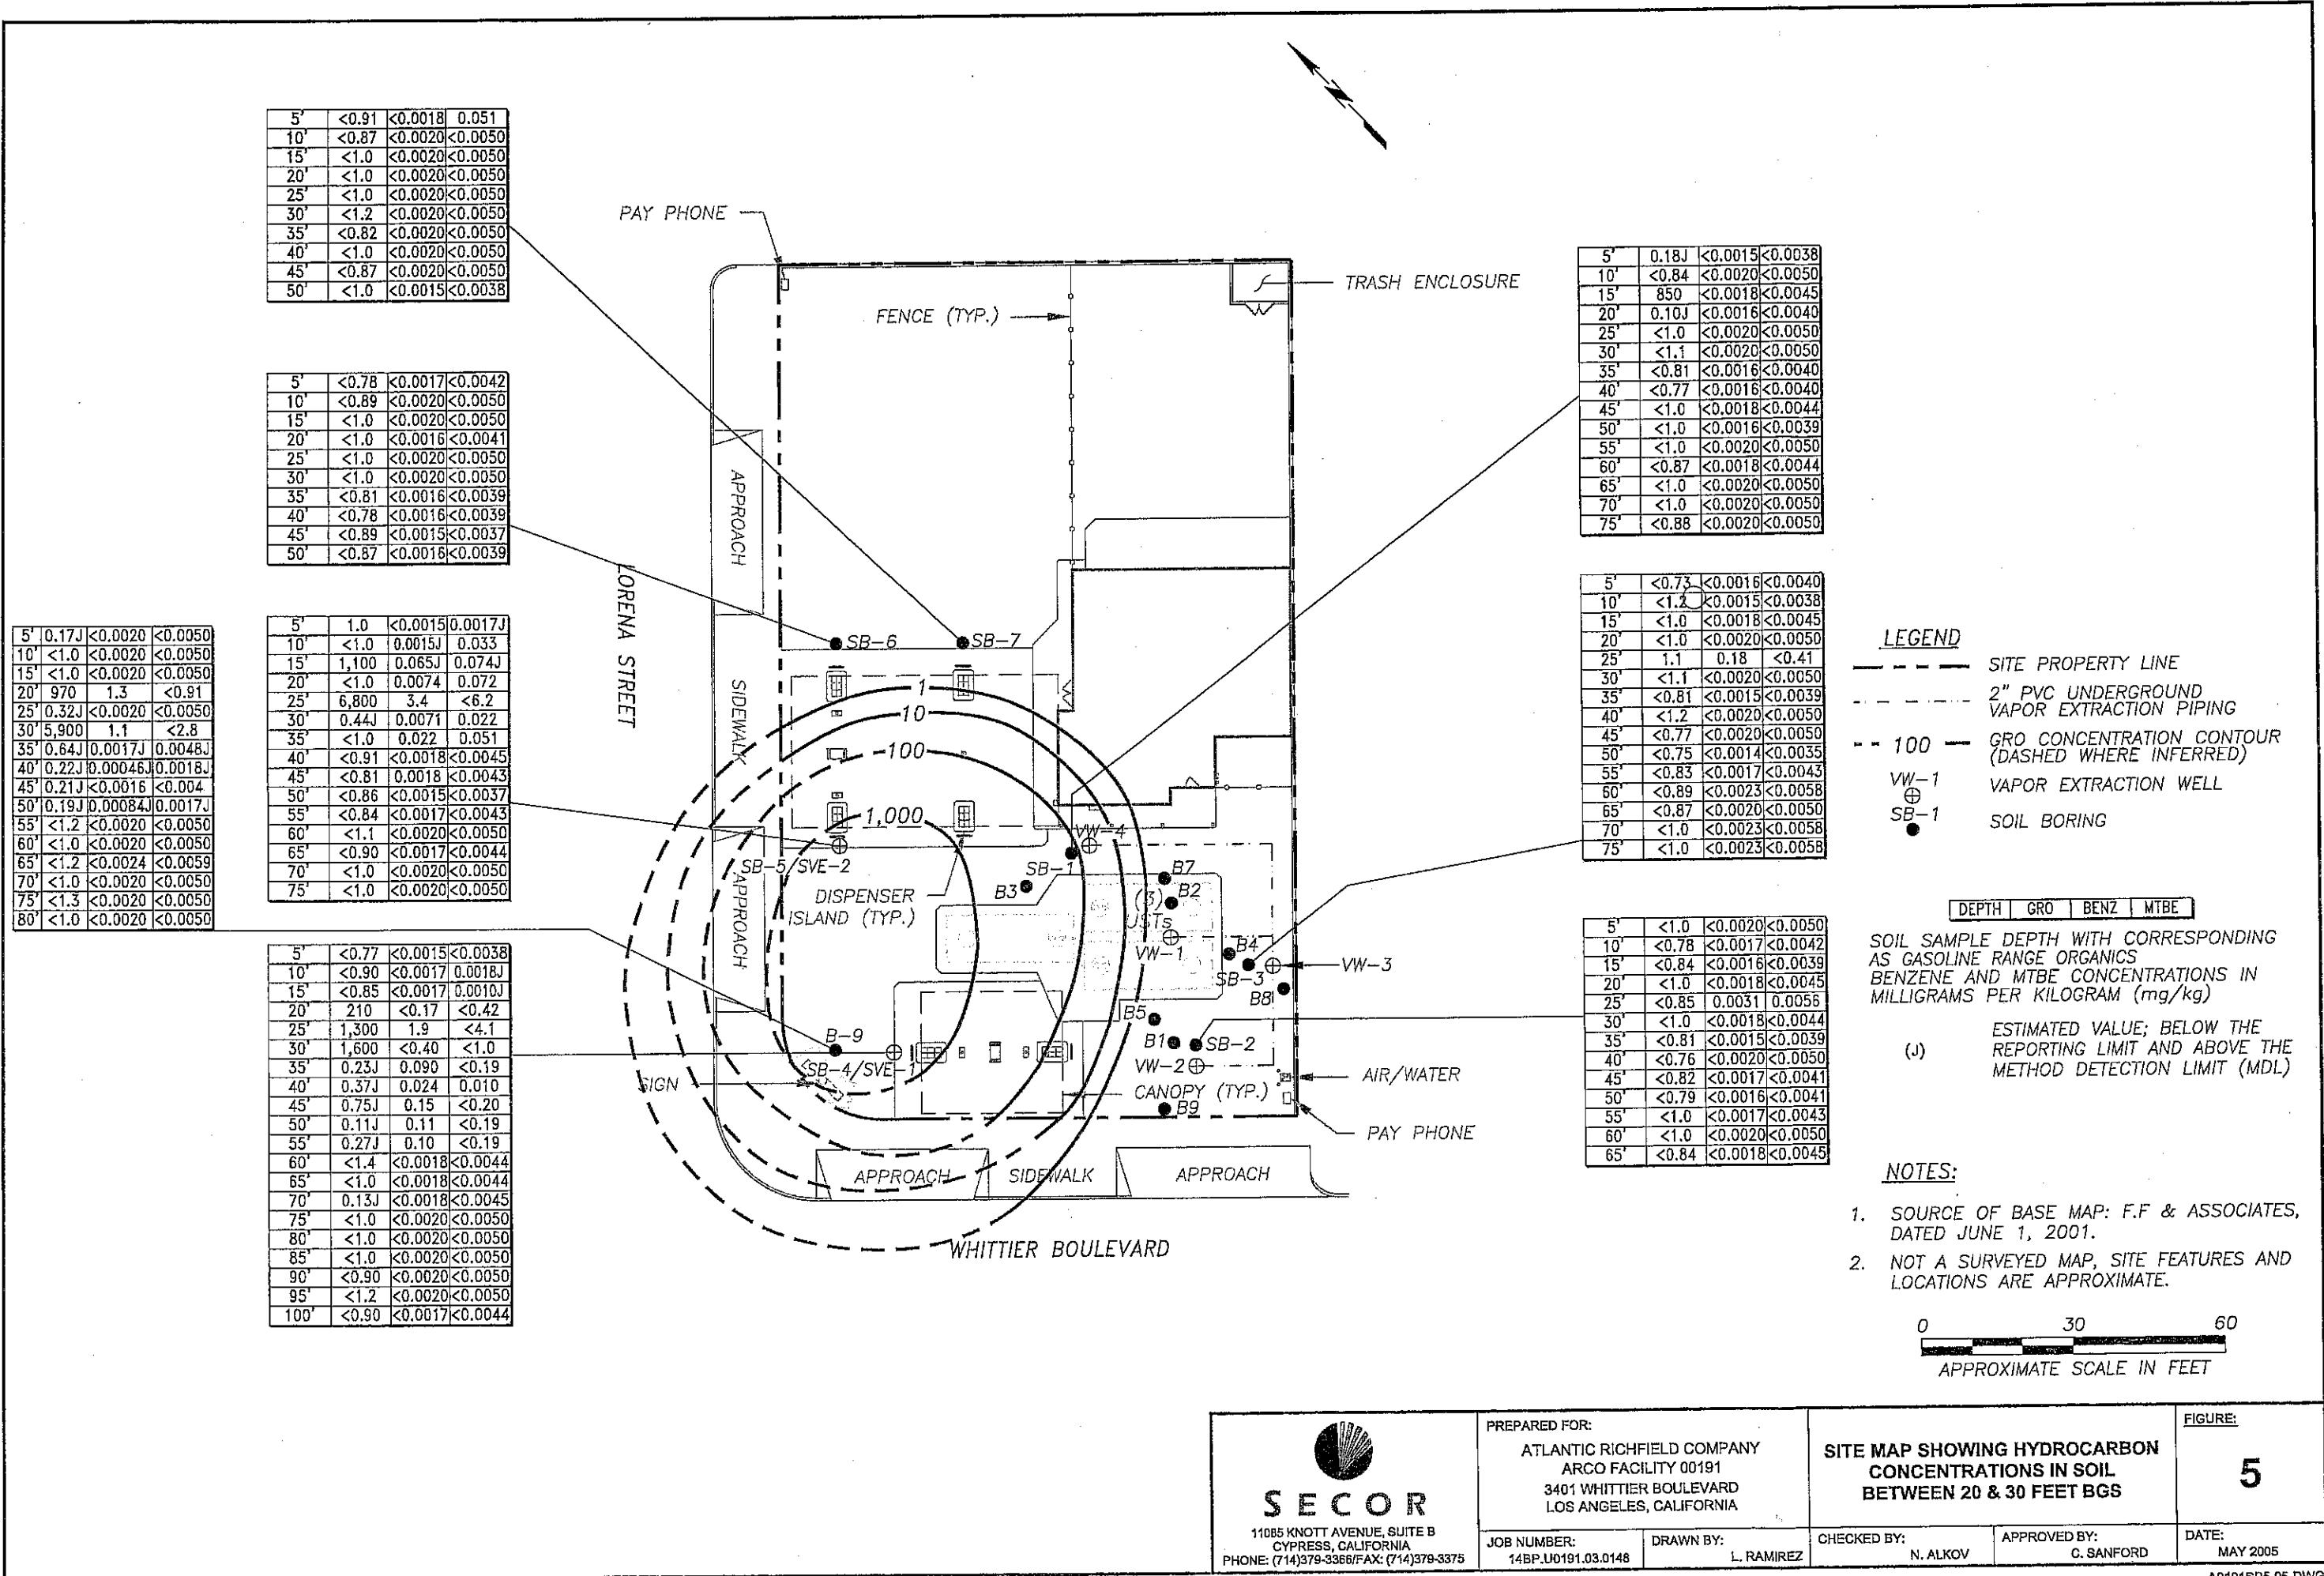

- (SW) WELL GRADED SAND
- (SW-SM) WELL GRADED SAND WITH GRAVEL
- (SP) POORLY GRADED SAND
- (SP-SM) POORLY GRADED SAND WITH SILT
- (SM) SILTY SAND, SILTY SAND WITH GRAVEL
- (ML) SILT, SANDY SILT, SILT WITH SAND
- (CL) LEAN CLAY, FAT CLAY, SILTY CLAY CLAY WITH SAND, SANDY CLAY
- (SC) CLAYEY SAND
- (AF) ARTIFICIAL FILL/BACK FILL
- ?— APPROXIMATE LITHOLOGIC CONTACT, QUERIED (?) WHERE INFERRED
- ASPHALT
- TINT COLOR OR OTHER CHANGE TO SAME LITHOLOGIC UNIT
- TPHG
MTBE SOIL SAMPLE LOCATIONS WITH TOTAL PETROLEUM HYDROCARBONS, BENZENE AND MTBE CONCENTRATIONS REPORTED IN MILLIGRAMS PER KILOGRAM (mg/Kg)
- (J) ESTIMATED VALUE; BELOW LABORATORY REPORTING LIMIT AND ABOVE METHOD DETECTION LIMIT (MDL)
- SCREENED INTERVAL OF WELL RELATIVE TO TOP OF CASING

Facility ID# 10846
RE: Permit # 9894

Arco Station No. 0191
3401 Whittier Boulevard
Los Angeles, California

Dear Mr. Vose:

The Fire Department has reviewed the Site Assessment Work Plan Report and Request for Closure dated August 13, 2003, as submitted by SECOR International Incorporated.

We are unable to approve your report regarding this site until we receive the following information:

- The report did not follow the work plan submitted on January 04, 2002. All boring numbers were changed from the Work Plan.
- There are high concentrations of hydrocarbon in the soil as indicated by SB-4 and SB-5. Further remediation is required.
- The lateral extent of the contamination was not defined. Step out boring B-9 was not drilled as indicated in the Work Plan.

Using the Site Address and Permit Number shown at the top of this letter, please label the title of your pending report to be submitted as " ADDITIONAL REQUIREMENTS - SITE ASSESSMENT REPORT".

April 22, 2004

Mr. Vose

Page 2

In order to facilitate further processing of your pending report and other document submittals, please complete and return the attached "Required Information Form" with your future submittals, according to the instructions at the top of the form

Failure to provide this information will delay the processing of this site

If you require additional information from the Los Angeles Fire Department, please contact Case Reviewer Marcus Look of the Environmental Unit, at (213) 978-3685.

Very truly yours,

WILLIAM R. BAMATTRE
Fire Chief

* Concentration values shown in parenthesis represent laboratory results

** Represents startup of Internal Combustion Engine

- 1) PID calibrated to 100 ppmv Isobutylene
- 2) TVH Mass Recovery Calculation:

$$\text{lbs. TVH} = \frac{(\text{ppmV})(60\text{min/l/hr})(\text{hrs})(\text{SCFM})(95 \text{ lb/lb-mole})}{(1 \times 10^6)(379 \text{ ft}^3/\text{lb-mole})}$$

ppmV = concentration in "Parts per Million by Volume" TVH as gasoline

SCFM = flow rate in Standard Cubic Feet per Minute

95 lb/lb-mole = average molar weight of gasoline

78 lb/lb-mole = average molar weight of benzene (use when calculating lbs. benzene)

379 ft³/lb-mole = molar gasoline volume at 60°F and 1 atmosphere

APPENDIX C

Standard Operating Procedure for Soil Sampling

The following procedures describe field techniques that are performed by SECOR International Incorporated (SECOR) personnel in the performance of the tasks involved with this project.

1.0 Locating Underground Utilities

Prior to the commencement of work on site, SECOR researches the location of all underground utilities with the assistance of Underground Service Alert (USA - Southern California toll free phone number 1-800-422-4133). USA contacts the owners of the various utilities in the vicinity of the site to have the utility owners mark the locations of their underground utilities. Prior to drilling, each boring is advanced manually using a hand auger and post-hole digger to a minimum depth of 5 feet to avoid contact with underground fuel distribution and/or vent lines and other unmarked utilities.

2.0 Soil Boring and Soil Sampling Protocol

Drilling and soil sampling are performed under the direction of a SECOR registered geologist. The soil borings are drilled using a truck-mounted drill rig equipped with hollow stem augers.

All down-hole drilling equipment is steam-cleaned prior to use and between each boring to reduce the chances of cross contamination. The split-barrel sampler is washed in soap solution, double rinsed with tap water, and sprayed with de-ionized water dispensed from a Hudson™ type sprayer between each sampling event to reduce the potential for cross contamination between samples. Hand augers are washed in soap solution, double rinsed with tap water between each sampling event, and sprayed with de-ionized water dispensed from a Hudson™ type sprayer to reduce the potential for cross contamination between samples during hand auger sampling.

Soil sampling is performed in accordance with the American Society for Testing and Materials Method 1586-84. Using this procedure a California-type sampler is driven into the soil every 5 vertical feet by a 140-pound weight falling approximately 30 inches. Three 6-inch brass or stainless steel liners are placed in the sampler for sample collection. Soil samples were collected using an EPA Method 5035 approved sampling device (EnCore™) from the deeper end of the lower-most intact brass/stainless steel ring containing in-situ soils. If continuously cored, a five foot core barrel is driven downhole just ahead of the lead auger. The core barrel is equipped with clear acetylene liners for sample retention. The acetylene liners are cut open and samples are collected using an EPA Method 5035 approved sampling device. The sample is then labeled, identified on the chain of custody, and stored in an ice-filled cooler for transport to the laboratory. Soil remaining in the sampler will be used for later screening with a photo-ionization detector (PID) or equivalent equipment. The soil is field screened by placing the soil in re-sealable plastic bags and allowed to reach ambient temperature. Headspace vapors in the bags are field screened with a calibrated PID. The highest observed stable reading is recorded onto the boring log. Another portion of the soil sample is used for lithologic classification and description by the United Soil Classification System using ASTM Method 2488.

3.0 Soil Sample Analyses

Soil samples are analyzed by the following analytes and in accordance with the appropriate Environmental Protection Agency (EPA) test method:

- 8015B: Total petroleum hydrocarbons as gasoline (TPHg); and
- 8260B: Benzene, toluene, ethylbenzene, and total xylenes (BTEX), methyl-tertiary-butyl ether (MTBE), di-isopropyl ether (DIPE), ethyl-tertiary-butyl ether (ETBE), tertiary-amyl-methyl ether (TAME), ethanol, and tertiary butanol (TBA).

	30		10 12 20	(SP) Poorly Graded Sand with Silt: (10YR 3/4) dusky red, fine grained sand, 10% silt, dense, moist.	9999	8015 8260B	B-9-30
	35		10 14 19	(ML) Silt with Sand: (10YR 3/6) dark red, 15% fine grained sand, low plasticity, hard, moist.	879	8015 8260B	B-9-35
	40						

The substrata descriptions above are generalized representations and based upon visual/manual classification of cuttings and/or samples obtained during drilling. Predominant material types shown on the log may contain different materials and the change from one predominant material type to another could be different than indicated. Descriptions on this log apply only at the specific location at the time of drilling and may not be representative of subsurface conditions at other locations or times.

LABORATORY REPORT

Prepared For: SECOR International, Inc.-Orange County
11085 Knott Ave, Suite B
Cypress, CA 90630

Attention: Cathy Sanford

Project: ARCO 0191, Los Angeles

Sampled: 11/10/04

Received: 11/11/04

Issued: 11/22/04 15:30

NELAP #01108CA CA ELAP #1197 CSDLAC #10117

The results listed within this Laboratory Report pertain only to the samples tested in the laboratory. The analyses contained in this report were performed in accordance with the applicable certifications as noted. All soil samples are reported on a wet weight basis unless otherwise noted in the report. This Laboratory Report is confidential and is intended for the sole use of Del Mar Analytical and its client. This report shall not be reproduced, except in full, without written permission from Del Mar Analytical. The Chain(s) of Custody, 2 pages, are included and are an integral part of this report.
This entire report was reviewed and approved for release.

CASE NARRATIVE

SAMPLE RECEIPT: Samples were received intact, at 4°C, on ice and with chain of custody documentation.

HOLDING TIMES: All samples were analyzed within prescribed holding times and/or in accordance with the Del Mar Analytical Sample Acceptance Policy unless otherwise noted in the report.

PRESERVATION: Samples requiring preservation were verified prior to sample analysis.

QA/QC CRITERIA: All analyses met method criteria, except as noted in the report with data qualifiers.

COMMENTS: Results that fall between the MDL and RL are 'J' flagged.

SUBCONTRACTED: No analyses were subcontracted to an outside laboratory.

Report Number: INK0967

Sampled: 11/10/04

Received: 11/11/04

DATA QUALIFIERS AND DEFINITIONS

AX	Sample too dilute to quantify surrogate
AZ	Surr. recovery outside of acceptance limits due to matrix interf.
DU	Insufficient sample quantity for matrix spike/dup matrix spike
IO	Contract limits originate from BP-GCLN Technical Requirements
J,DX	EPA Flag - Estimated value, Value < lowest standard (MQL), but > than MDL
LP	Laboratory Control Sample recovery was above method control limits. Analyte not detected, data not impacted.
RB	RPD exceeded method control limit; % recoveries within limits.
ND	Analyte NOT DETECTED at or above the reporting limit or MDL, if MDL is specified.
RPD	Relative Percent Difference

ADDITIONAL COMMENTS

For 8260 analyses:

Due to the high water solubility of alcohols and ketones, the calibration criteria for these compounds is <30% RSD.

The average % RSD of all compounds in the calibration is 15%, in accordance with EPA methods.

For GRO (C4-C12):

GRO (C4-C12) is quantitated against a gasoline standard. Quantitation begins immediately following the methanol peak.

8015 Analysis EDF Parlabel Cross Reference

Analyte	EDF
GRO (C4 - C12)	Parlabel GROC4C12
